AUTHOR: Sudzilovskiy, N. B., Engineer

TITLE: Reproduction of Typical Non-linearities

PERIODICAL: Priborostroyeniye, 1960, No. 6, pp. 1-3

TEXT: In the article under review, the author studies some problems related to the accuracy of reproduction of typical non-linear functions by means of diode systems. The first part deals with the simulation of the restriction of coordinates according to a certain modulus. This is illustrated by a circuit diagram used for simulating a saturation effect (Fig. 1). The second part deals with the simulation of the zone of insensitivity. First, the author describes the circuit diagram shown in Fig. 2, which results from the one shown in Fig. 1 by a different arrangement of the same circuit elements. In order to warrant equal sensitivity before and behind the zone of insensitivity, it is necessary to use an additional direct-current source with corresponding voltage dividers at the output (Fig. 3). The simulation of a clearance, which is described in the third part, requires a negligibly small moment of

PROCESSES AND PROPERTIES INDEX

Anti-Friction Aluminium Alloys. B. D. Grom and N. M. Studzinsky. *Trudy Tsentral. Lab. Zavoda "Bol'shevik,"* 1940, 103-105; *Khim. Tekhnol. Zhur.*, 1941, 4, (4), 92-93; *C. Abs.*, 1943, 37, 5350. [In Russian.] The resistance to wear of aluminum alloys containing: (i) copper 4.55-11.18, silicon 0.18-19.3, and iron 0.10-1.83%, and (ii) zinc 0.57-8.32, silicon 0.25-0.35, and iron 0.50-0.88%, was tested against steel rings and against cast iron rings with Brinell hardness 187. The steel rings produced considerable wear. This is attributed to the liquation of silicon, the formation of aluminum silicides, and the formation of a thin layer of aluminum oxide on the rubbing surfaces. Best results were obtained with zinc-containing alloys. Alloys containing 1.5-3.0% of zinc are recommended.

STUGAREV, A.S.

3532. FIGHT FOR A FURTHER IMPROVEMENT IN THE SAFETY OF LABOUR IN MINES.
 Stugarev, A.S. (Ugal (Coal, Moscow), June 1956, 5-10). The accident rate in U.S.S.R. mines is not improving, although some mines have no accidents. The percentages of accidents due to different causes are given for 1954 and 1955. Direct fatal breakage and fall of pieces of coal and rock 34.1 and 35.1% and damage, twisting and lowering 26.5 and 25.5%. Some Polish figures are given for the increase in the number of earth shocks with depth of mining. The number per 100,000 tons mined rises from 0 at 150 m to 14.7 at 550 m. The life of winding cables is very short; it was down to 6 months in 1946-1947. Lack of progress in ventilation, degassing of coal seams, prevention of sudden eruptions of coal and gas, and use of explosion-proof equipment and safety explosives, is remarked on. Life saving equipment, of the filtering type, is out of date and insufficient. (L).

TITLE:

An Important Method of Intensifying Mine Work
(Vazhnyy metod intensivifikatsii gornyykh rabot)

PERIODICAL:

Vestnik Akademii nauk SSSR, 1959, Nr 2, pp 109-111 (USSR)

ABSTRACT:

A scientific-technical conference which took place from November 26 to 28, 1958 and had been convened by the Mezhdovedomstvennaya komissiya po vzryvnomu delu pri Institute gornogo dela Akademii nauk SSSR (Inter-Departmental Committee of Explosives at the Mining Institute of the Academy of Sciences, USSR) dealt with problems of shortly delayed explosions (SDE) for opencast and underground mining of deposits. Furthermore, the author mentions the following reports:

G. I. Pokrovskiy describes his assumption on the course of shortly delayed explosions and their effect on the structure of rocks.

A. N. Khanukayev regards it as being necessary to take into account the energy losses for plastic deformations of the

An Important Method of Intensifying Mine Work

SOV/30-59-2-30/60

horizon in the computation formulae for the bursting charge. Khanukayev and N. L. Rossinskiy found that there is no interference of reflected waves in shortly delayed explosions. K. I. Ogurtsov reported on the computation methods of tensions in the formation of explosion craters. N. L. Rossinskiy spoke of safety problems in shortly delayed explosions in coal mines. Ya. I. Tseytlin, Soyuzvzryvprom, A. P. Steposhko, Noril'skiy kombinat (Noril'sk Kombinat) reported on papers published by the Makeyevskiy nauchno-issledovatel'skiy institut (Makeyevka Scientific Research Institute) in the field of methane determination and the computation of the duration of elastic oscillation in the massif after explosions. M. A. Magoychenkov and N. G. Petrov discussed the technical and economic results of the application of shortly delayed explosions in the coal industry. L. A. Paporotskiy mentioned data on the efficiency of shortly delayed explosions in comparison to the normal method. It was recommended by the conference to introduce the method of shortly delayed explosions.

Calculation of the Cooling of the Metal during Hot Rolling.
A. G. Stukach. (Stal, 1955, (7), 626-629). [In Russian]. As
a basis for the estimation of metal/roll pressures in hot rolling
a method is developed for calculating metal temperature at
every pass. Heat loss from the metal is assumed to be by
radiation only, heat input being by deformation. The method
was used for calculating metal cooling during the rolling of
wire 6-5 mm in dia., of 12 x 2650 mm sheet and a 310 mm
Z-beam, giving good agreement with observed temperatures.
Some previously proposed methods of calculation are briefly
considered. A. K.
